Business Proposal

Lecturer: Dr. Harmi Izzuan Bin Baharum

Prepared by: Goe Jie Ying (A23CS0224)

Category: Bank (Applications)

Subcategory: CIMB OCTO

Introduction

CIMB OCTO is a mobile banking application designed for CIMB Bank customers, especially for personal financial management. It provides the customers with seamless financial service, such as fund transfer, bill payments and fixed deposits. As digital banking becomes increasingly competitive, OCTO was developed as a next-generation upgrade to CIMB Click, offering a more user-friendly, modern and simplified interface to the for over 10.8 million customers nationwide. The goal of this proposal is to introduce further improvements to OCTO's functionality, performance, and security to strengthen CIMB's position as a leading digital bank in Malaysia and across the ASEAN region.

Problem

The primary challenge is the lack of feature awareness. Despite strong adoption rates, many customers still weren't aware of a range of features in the application. Internal user feedback suggests that most customers primarily use the app for basic functions such as fund transfers and bill payments. Another issue frequently highlighted by users on social media platforms is the app's performance stability. Some users have reported lagging and delays during fund transfer, or even blank displays during crucial activities. Lastly, OCTO currently provides a uniform dashboard for all users, with limited personalization, which may result in a decrease in user engagement and loyalty.

Solution

We propose developing an in-app tutorial and pop-up guide to help customers to discover lesser-known features, such as Cash Plus Personal Loan, TIA-i and Investments. Second, we recommend carrying out a performance optimization process to reduce app lag, speed up loading time, and ensure stable transactions for smoother app usage. Lastly, we propose to create a personalized dashboard that allows users to view spending summaries, frequent transactions, and recent activities according to their own financial habits. The estimated development cost is RM200,000 which covers technical enhancement, user interface upgrades, and one year of maintenance support.

Justification

We are requesting RM200,000 to carry out these improvements. The upgrades will directly benefit customers by:

1. Offer faster and more stable transactions to make daily banking more convenient
2. Help customers to explore new financial features that suit their needs
3. Assist customers to monitor their spendings, savings and make informed financial decisions

According to Bank Negara Malaysia's 2023 data, since most Malaysians now do their banking through mobile apps, these improvements will help OCTO users enjoy faster, easier, and more personalized banking every day.

Conclusion

In conclusion, this proposal aims to improve the CIMB OCTO app by providing faster performance, better guidance, and a more personalized user experience. These enhancements will make everyday banking simpler, safer, and more enjoyable for every CIMB customer. With these improvements, OCTO can continue to grow as one of Malaysia's leading digital banking platforms.
